

Log-On

Software is happy to announce:

ICPU/CICS

The most popular CICS monitors that evaluate the CPU usage in a CICS environment report regularly on a transaction level – not on program level or specific CICS commands executed. Other types of monitors require a cumbersome set-up and are difficult to use, and the amount of CPU they use during the sampling makes it virtually impossible to run them in a production environment. Sounds familiar?

The solution is:

ICPU/CICS

- 👉 A new tool for the CICS environment – easy to install, easy to handle, easy to understand – equally suitable for application and system programmers
- 👉 Measured overhead is only ~5% - never mind what workload you are running on that CICS system – it is POSSIBLE to run in production without being worried of its performance impact
- 👉 Measurements can be shown ONLINE or Batch – with a detailed list of the OFFSETS of the CPU guzzling statements
- 👉 Can sample a complete CICS system or be limited to a set of programs or Terminals
- 👉 Full details on the application code and executed CICS commands

**"The earlier that performance problems are discovered,
the less it costs to fix them"**

ICPU/CICS

**ICPU/CICS shows you which programs and which statements in the programs are the
CPU guzzlers in your CICS system with a minimal overhead!**
